Question 1

A wire-coating die consists of a cylindrical wire of radius, κR, moving horizontally at a constant velocity, v_{wire}, along the axis of a cylindrical die of radius, R. You may assume the pressure is constant within the die (it is not pressure driven flow) but the flow is driven by the motion of the wire (it is "axial annular Couette flow"). Neglect end effects and assume an isothermal system.

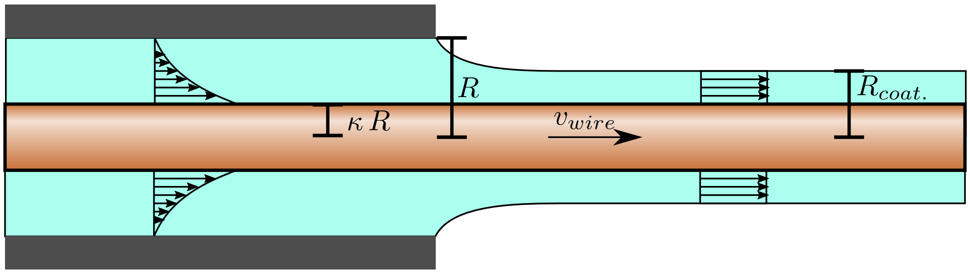

Figure 1: *A diagram of a wire coating die for Q. 1.*

a) State the two relevant boundary conditions for the flow within the die and what they imply. **[3 marks]**

b) The stress profile for an annular system is of the following form,

$$\frac{1}{r}\frac{\partial}{\partial r} r\,\tau_{rz} = -\frac{\partial p}{\partial z} + \rho\, g_z.$$

Derive the following expression for the flow profile,

$$v_z = \frac{v_{wire}}{\ln \kappa} \ln\left(\frac{r}{R}\right).$$

Make sure to give each stage of any derivations including any boundary conditions used, and the solution for any integration constants. **[14 marks]**

c) Derive the following expression for the volumetric flow-rate of liquid through the die

$$\dot{V}_z = -\pi R^2 v_{wire}\left(\kappa^2 + \frac{1-\kappa^2}{2\ln\kappa}\right).$$

[9 marks]

Note: You will need the integration identity

$$\int x \ln(x)\,\mathrm{d}x = \frac{x^2}{2}\left(\ln(x) - \frac{1}{2}\right).$$

d) Derive an expression for the outer radius of the coating, $R_{coat.}$, far away from the die exit. **[7 marks]**

Question 2

In prilling towers, molten fertilizer slurry is dripped to form frozen spherical pellets called prills. As a first approximation to understanding the heat transfer from the falling prills, consider a heated sphere of radius, R, and fixed surface temperature, T_R, suspended in a large, motionless body of fluid.

a) Starting from the overall energy balance equation (Eq. (4) on page 6), show that it can be simplified it to the following form,

$$\nabla \cdot \vec{q} = 0$$

Show your workings and state any assumptions made in the derivation of the equation (including any implicit assumptions in the energy balance equation). **[7 marks]**

b) Demonstrate the differential equation simplifies to the following result,

$$\frac{\partial}{\partial r} r^2 \frac{\partial T}{\partial r} = 0.$$

You may assume the thermal conductivity, k, of the fluid is constant. **[7 marks]**

c) Integrate the differential equation and use these boundary conditions to determine the integration constants: at $r = R$, $T = T_R$; and at $r = \infty$, $T = T_\infty$. Demonstrate that the final result becomes the following,

$$T = T_\infty + (T_R - T_\infty) \frac{R}{r}.$$

[8 marks]

d) From the temperature profile, obtain an expression for the heat flux at the surface. Equate this result to the heat flux given by "Newton's law of cooling" and show that a dimensionless heat transfer coefficient (known as the Nusselt number) is given by,

$$\mathrm{Nu} = \frac{h\,D}{k} = 2,$$

in which D is the sphere diameter. **[12 marks]**

Question 3

a) A twin-tube counterflow heat exchanger (Fig. 2) operates with air flow rates of 0.003 kg s^{-1} for both hot and cold streams. The cold stream enters the heat exchanger at 280 K and must be heated to 340 K using hot air that enters the domain at 360 K. The average pressure of the airstreams is 1 atm and the maximum allowable pressure drop for the cold airstream is of 10 kPa. The tube walls may be assumed to act as fins, each with an efficiency of 100%.

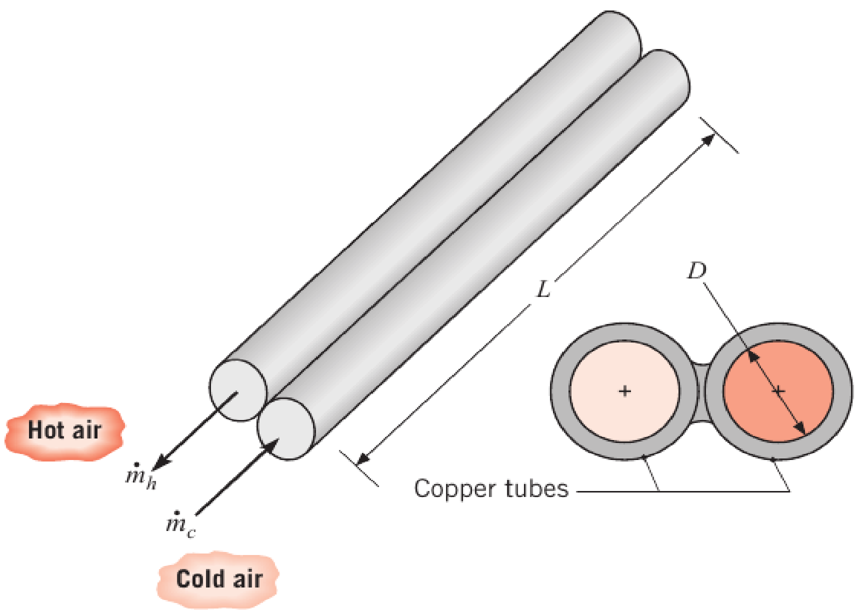

Figure 2: *Twin-tube counterflow heat exchanger.*

(i) Determine the effectiveness and Number of Transfer Units (NTU); **[5 marks]**

(ii) Find the tube diameter D and L that satisfy the prescribed heat transfer and pressure drop requirements. In case you have not managed to solve part (ai), you may assume $\epsilon = 0.7$; **[15 marks]**

(iii) Calculate the heat transfer coefficient. In case you have not managed to solve part (ai) and (aii), you should assume $D = 9 \times 10^{-3}$ m and $L = 2.6$ m. **[5 marks]**

Given:

- Thermophysical properties of air: $\rho = 1.128$ kg m^{-3}; $C_p = 1.007$ kJ (kg K)$^{-1}$; $\mu = 18.93 \times 10^{-6}$ $m^2 s^{-1}$; $\kappa = 0.0270$ W (m K)$^{-1}$; $Pr = 0.7056$;
- Tube Reynolds number: $Re_D = 4\dot{m}(\pi D \mu)^{-1}$, where $\dot{m}$ is the mass flow rate;

- Colburn correlation for turbulent and fully developed flow: $Nu_D = hD\kappa^{-1} = 0.023Re_D^{0.8}Pr^{1/3}$;
- Pressure drop for fully developed flow: $\Delta P = f\rho u_m^2 L(2D)^{-1}$, where $u_m \left(= \frac{4\dot{m}}{\rho\pi\frac{D^2}{4}}\right)$ is the mean flow velocity, and $f \left(= [(0.79\ln(Re_D) - 1.64)]^{-2}, \text{ for } 3000 \leq Re_D \leq 5\times 10^6\right)$ is the Moody friction factor;
- The effectiveness relation for this heat exchanger is $NTU = \epsilon/(1-\epsilon)$.

b) Steel balls of 12 mm in diameter are annealed by heating to 1150 K and then slowly cooled to 400 K in an air environment $\left(T_\infty = 325 \text{ K and h} = 20 \text{ W m}^{-2}\text{K}^{-1}\right)$. Estimate the time required for the cooling process. Given thermophysical properties of steel: κ = 40 W(m K)$^{-1}$, ρ = 7800 kg m^{-3} and C_p = 600 J(kg K)$^{-1}$. **[8 marks]**

In Cartesian coordinate systems, ∇ can be treated as a vector of derivatives. In curvelinear coordinate systems, the directions $\hat{\boldsymbol{r}}$, $\hat{\boldsymbol{\theta}}$, and $\hat{\phi}$ depend on the position. For convenience in these systems, look-up tables are provided for common terms involving ∇.
