Question 1

In a plate heat-exchanger (see Fig. 1), water is heated by forcing it between alternating plates and heat is exchanged through the walls with a hot process stream. In order to design such an exchanger, we need to know what the relationship is between pressure drop, flow velocity, and volumetric flow-rate.

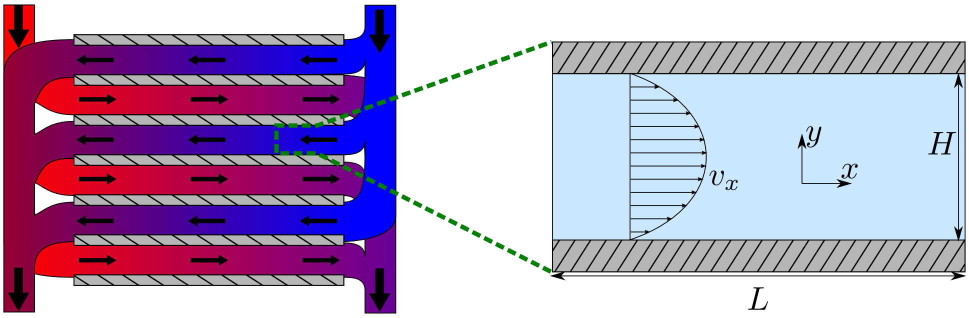

Figure 1: *A plate heat exchanger (left) and the simplification to steady state, pressure driven flow between two horizontal plates (right).*

You may neglect the effect of heat transfer on the flow. Water is incompressible and Newtonian to a good approximation. For simplicity, you can also assume that the flow is laminar.

a) Simplify the continuity equation for this system:

$$\frac{\partial \rho}{\partial t} = -\nabla \cdot \rho\, \boldsymbol{v}$$

What does your result state about the flow velocity in the x-direction? **[7 marks]**

b) Simplify the x-component of the Cauchy momentum equation:

$$\rho \frac{\partial \boldsymbol{v}}{\partial t} = -\rho\, \boldsymbol{v} \cdot \nabla \boldsymbol{v} - \nabla \cdot \boldsymbol{\tau} - \nabla p + \rho\, \boldsymbol{g}$$

Derive the following balance expression for the flow velocity v_x as a function of the pressure drop and position y: **[10 marks]**

$$\mu \frac{\partial^2 v_x}{\partial y^2} = \frac{\partial p}{\partial x}$$

c) Derive the following expression for the velocity v_x as a function of y using the no-slip boundary condition at the plate surfaces ($v_x = 0$ at $y = 0$ and $y = H$). **[10 marks]**

$$v_x = \frac{p_{out} - p_{in}}{2\,\mu\, L}(y^2 - H\,y)$$

d) Integrate the velocity over the plate height and width to prove the following expression for the volumetric flow of liquid through the gap as a function of pressure drop: **[6 marks]**

$$\dot{V}_x = \frac{Z\,H^3}{12\,\mu}\frac{\Delta P}{L}$$

Question 2

The temperature profile inside a nuclear fuel rod is needed as part of the design calculations for a reactor. The rod is a cylinder with a radius, R, and is assumed to be composed of a homogeneous fuel which is producing heat with the following profile:

$$\sigma_{heat} = \sigma^0\left(1 + b\left(\frac{r}{R}\right)^2\right)$$

a) What assumption has been made to derive the energy balance equation below?

$$\rho\,C_p\frac{\partial T}{\partial t} = -\rho\,C_p\,\boldsymbol{v}\cdot\nabla\,T - \nabla\cdot\boldsymbol{q} - \boldsymbol{\tau}:\nabla\,\boldsymbol{v} - p\nabla\cdot\boldsymbol{v} + \sigma_{energy}$$

[3 marks]

b) Simplify the energy balance equation to the following expression:

$$\frac{1}{r}\frac{\partial}{\partial r}\left(r\,q_r\right) = \sigma_{energy}$$

Clearly state any assumptions you use. **[14 marks]**

c) Derive the expression below for the heat flux from the simplified energy balance.

$$q_r = \sigma^0\left(\frac{r}{2} + b\frac{r^3}{4\,R^2}\right)$$

Clearly state any assumptions you use. **[8 marks]**

d) Derive the following expression for the temperature profile.

$$T - T_0 = \frac{\sigma^0}{k}\left(\frac{R^2 - r^2}{4} + b\frac{R^4 - r^4}{16\,R^2}\right)$$

You will need to select an appropriate boundary condition and give the meaning of the constant T_0. **[9 marks]**

Question 3

a) In a manufacturing facility, 10 cm diameter brass balls initially at 121°C are quenched in a water bath at 49°C for a period of 2 min and at a rate of 120 balls per minute. If the average convective heat transfer coefficient is 238 W $m^{-2\circ}$ C^{-1}, determine:

  i) Temperature of the balls after quenching, and; **[10 marks]**

  ii) Rate (in kW) at which heat needs to be removed from the water in order to keep its temperature constant at 49°C. **[4 marks]**

  Given properties of brass: k = 111 W $m^{-1\circ}K^{-1}$, ρ = 8552 kg m^{-3} and C_p = 285 J $kg^{-1\circ}K^{-1}$

b) Consider an oil-to-oil double-pipe heat exchanger whose flow arrangement is not known. The temperature measurements indicate that the cold oil enters at 20°C and leaves at 55°C, while the hot oil enters at 80°C and leaves at 45°C.

  i) Is this parallel-flow or counter-flow heat exchanger? Why? **[5 marks]**

  ii) Assuming the mass flow rates of both fluids to be identical, determine the effectiveness of this heat exchanger. **[5 marks]**

c) A cross-flow air-to-water heat exchanger with effectiveness of 0.65 is used to heat water with hot air. Water enters the heat exchanger at 20°C at a rate of 5 kg s^{-1}, while air enters at 100°C at a rate of 12 kg s^{-1}. If the overall heat transfer coefficient based on the water side is 200 W $m^{-2\circ}C^{-1}$, determine the heat transfer surface area of the heat exchanger on the water side. Given $C_{p,\text{water}}$ = 4180 J $kg^{-1\circ}C^{-1}$ and $C_{p,\text{air}}$ = 1010 J $kg^{-1\circ}C^{-1}$. **[9 marks]**

In Cartesian coordinate systems, ∇ can be treated as a vector of derivatives. In curve-linear coordinate systems, the directions $\hat{\boldsymbol{r}}$, $\hat{\boldsymbol{\theta}}$, and $\hat{\phi}$ depend on the position. For convenience in these systems, look-up tables are provided for common terms involving ∇.
